## Having salivary gland injections (Easy Read)

You dribble a lot at the moment because of your medical condition. The dribble comes out of your salivary glands around your chin. You are coming to hospital for a small operation.

This operation will stop you dribbling so much.

While you are under general anaesthetic, the doctor will use an ultrasound scan to check your salivary glands.

The doctor will put an injection into your salivary glands.

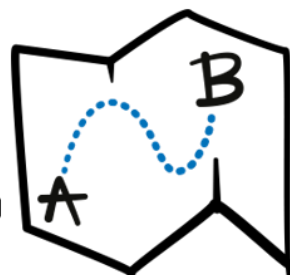

You can wake up from the anaesthetic in a bed on the ward.

You can eat and drink again when you feel like it.

You can go home when you have had something to eat and drink.

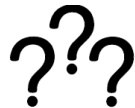

You might feel a bit sore when you get home. You can take pain medicine to help.

You can go back to school the day after the operation.

Please ask us if you have any questions.
