

Sleep electroencephalogram (sleep EEG): information for families

Electroencephalogram (EEG) is a test that looks at the function of the brain. The brain works by a series of electrical signals. These signals (also called brainwaves) can be recorded through the scalp. This information sheet from Great Ormond Street Hospital (GOSH) explains the procedure for a Sleep EEG test and what to expect when your child has one. An Easy Read information sheet is included for your child.

In most cases, we prefer the person bringing your child to their appointment to have 'Parental Responsibility' for them. Parental Responsibility refers to the individual who has legal rights, responsibilities, duties, power, and authority to make decisions for a child. This is because the person may need to give consent for your child to have the test. If you are unable to attend with your child but we still need you to give consent, we might need to contact you by phone during the test.

Having a sleep EEG means your child will be encouraged to sleep during their EEG test. There are two methods for this that we recommend at GOSH. You can choose to keep your child up the night before the test and wake them up early in the morning, or we can give them a medicine called melatonin. More information about these methods can be found below.

How is a sleep EEG used?

Recording the EEG during drowsiness and sleep can be useful to identify brain activity which may not be there while your child is awake. It can be carried out on patients of all ages and abilities, making it a good way to get an overall view of the function of the brain. It is helpful as part of general investigations and more specific problems, such as seizures and blackouts.

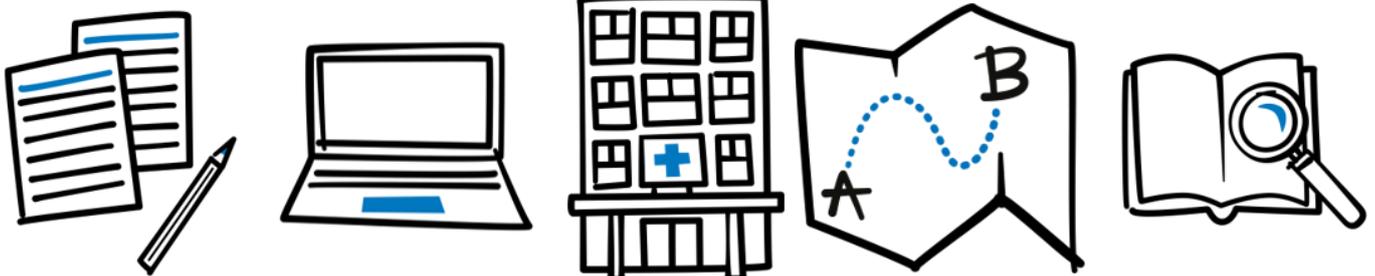

Getting your appointment letter

If you are unable to keep this appointment, please inform the department as soon as possible beforehand. Sometimes, we can offer the appointment to another child on the waiting list.

Please note that there is great demand for our services. Due to this demand, we have a policy where if a child cancels or does not attend **two** appointments in a row, we will inform their referring consultant and close the referral.

Getting ready for the test

It is helpful if you make sure that your child's hair is clean before the test, with no gel, oil, mousse, or hairspray. If your child is taking medicines, you should continue to give them as normal.

If you have other children, it is better if they could be looked after at home or by another adult if they come with you. We are unable to look after them during the test.

As we need your child to sleep during the test, we suggest two methods:

Sleep deprivation: We will ask you to keep your child up past their bedtime for two hours on the evening before the test and then wake them up two hours earlier on the day of the test. It is also important that you **do not** let your child fall asleep on the way to the hospital.

Melatonin: This is a naturally occurring hormone found in the brain and is thought to be important for sleep. We use a medicinal preparation of the hormone that comes as a liquid, tablet, or capsule. There are no known risks associated. If you choose this method, it is still important that you do not let your child fall asleep on the way to the hospital.

The day of the test

Your child will have a sleep EEG in the Department of Clinical Neurophysiology, which is on Level 4, Southwood Building.

Once you are in the EEG department, check in at the reception desk and a clinical physiologist will come to meet you. They will confirm your and your child's details and take you to the recording room.

They will explain in more detail how the test will take place and discuss any worries you may have. They will also ask you to give permission for video recording by signing a consent form. They might also ask you to give permission for any extra procedures that the doctor has asked for. This could include looking at flashing lights or hyperventilating ('over-breathing').

Students and trainees

As we are a teaching hospital, on occasion you might be asked if you would agree to a trainee to perform the test under supervision. Sometimes other healthcare professionals or students might ask to observe the test as well. Saying no to this will not affect your child's treatment.

What does the test involve?

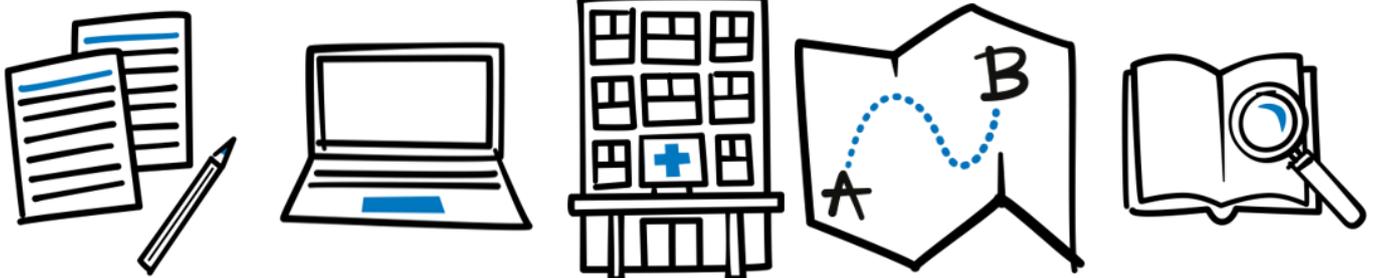

The physiologist will attach a number of small silver discs (electrodes) to certain points on your child's head using a soft past. Sometimes, they will measure their head and mark the points with a soft pencil before attaching the electrodes. Extra electrodes will also be applied on the shoulders to record your child's heart rate and muscle activity. Sometimes, additional electrodes may be applied to other areas to get more information.

As each electrode is attached, the physiologist will clean the area of the scalp with a cotton bud and some cream. This does not hurt but some children do not like it. This should take around 20 to 30 minutes. While all the electrodes are being applied, your child can sit on a chair, the bed, or your lap, and can play with toys – we have many toys in the department but feel free to bring your child's own favourite book, toy, or comforter.

The electrodes are attached by wires to a 'headbox' and then to the recording machine. The physiologist will record your child's brainwaves on to the computer and monitor them on a screen – they look like wiggly lines. Your child will not feel anything while the sleep EEG is being recorded. At the same time, the digital video recording of your child will be made – this is helpful for the doctor to see any changes in behaviour or movements that could be linked to seizure activity on the recording.

The test has two parts:

Wakefulness: We will record for 20 to 30 minutes while your child is awake. During this part of the

test, the physiologist may ask your child to lie or sit quietly if they can.

If your child is old enough, we may also ask them to do some tasks, such as close their eyes for short periods of time, take deep breaths by blowing on a windmill (over-breathing) or look at flashing lights (intermittent photic stimulation). Your child will be continuously monitored throughout the test and these tasks will be stopped if necessary.

Sleep: Your child will be encouraged to sleep. We will turn the lights off and they can lie on the bed or on your lap. Once they fall asleep, 20 to 30 minutes will be recorded. Your child will be woken up after this. If you choose to use melatonin, this will be given to your child at the start of the test. This is usually given as a liquid with the help of an oral syringe.

How long does the test last?

The test takes between 90 and 120 minutes. There are plenty of toys to play with and another member of staff to help if needed. A bottle or a drink might be helpful for younger children.

Are there any risks?

No. The sleep EEG test is painless and there are no aftereffects. Melatonin has been reported to cause some sleepiness, but this will not last for long. Your child can go back to school or nursery after the test if you wish.

What happens if my child has a seizure during the test?

If your child has a seizure during the test, their safety will be our first priority and we will take care of them, making sure your child is well enough to leave.

After the test

The physiologist will remove the electrodes from your child's head. This will not hurt as the paste stays soft and is easy to remove. They will also clean your child's hair, but it may feel a bit sticky to the touch until you wash it. Once all the electrodes have been removed, you will be free to go if no other tests or appointments have been planned.

If your child took melatonin to help them sleep, it is unlikely that this will cause sleepiness on the way home from hospital. If you are at all concerned, please tell us so we can arrange for one of our doctors to check that your child is well before going home.

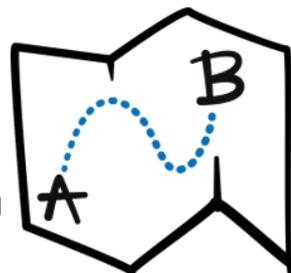

Getting the results

You will not be given the results during the appointment. A detailed report will be written and sent to your child's consultant in time for their next appointment.

Further information and support

If you require more information about the test or have any questions, please contact the Department of Clinical Neurophysiology on 020 7813 8471, Monday to Friday between 9am and 5pm.

CBeebies "Get Well Soon Hospital" series has an episode about having an EEG – Series 2, Episode 5 at www.bbc.co.uk/iplayer/episode/b09204fx/get-well-soon-hospital-series-2-5-eeeg

How to find us

Come in through the main entrance and walk through the main reception. At the glass doors, turn right and then first on the left (you are entering Southwood Building). Walk through the corridor until you find the stairs and the lifts. Come up to Level 4 and walk through the double doors and then down the corridor until you find another set of double doors. EEG Reception is on your right.

For more information about travelling to GOSH, please visit our website on www.gosh.nhs.uk/your-hospital-visit/travelling-gosh

Your feedback

We take all feedback very seriously and want to hear about your experiences. Your feedback helps us to understand what we are doing well but importantly how we can improve. We will give you a feedback card during your stay on the ward but if you haven't received one, please ask a member of staff. You can also provide feedback using this QR code or via our website:

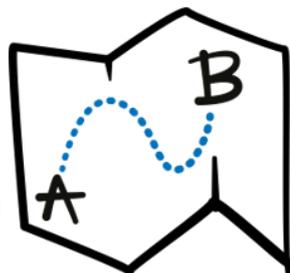

<https://www.gosh.nhs.uk/your-opinion-matters/>

Any concerns?

We know we do not always get things right. Please do raise any queries or issues with the ward/ clinic staff in the first instance. We want to help and often we are able to resolve things quickly.

Another way of raising a concern is to contact our **Patient Advice and Liaison Service 'Pals'** – they are based in the main reception area and open from Monday to Friday from 10am to 5pm. You can also call them on 020 7829 7862 or email pals@gosh.nhs.uk. The Pals team can offer independent advice and support, working with you to sort out a problem along with members of staff.

The **Complaints** team are also available if you want to make a complaint – you can call them on 020 7813 8402 or email complaints@gosh.nhs.uk

Having a sleep EEG

You are coming to hospital for a Sleep EEG test. An EEG records your brain waves. This helps the doctors work out how to look after you.

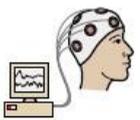

You might need to take some medicine to make you sleepy.

You will have this test while you are awake and then asleep.

We will clean small areas of your head then fix some silver discs with stickers and paste. This will not hurt.

We will join the stickers to the EEG machine with wires. This will not hurt.

We will also make a video of you. This will show us if you move around in bed. When you have been sleeping for about 30 minutes, we will wake you up.

We will take off the stickers and wipe your head again.

If you are not having any other tests, you can go home.

Please ask us if you have any questions.
